

TripTrail — Product Requirements (v1.0)

Author: Maya Chen. Status: approved for launch.

1. Problem

Weekend travellers in South India plan trips across three or four apps: one for buses, one for stays, one for maps and a WhatsApp group to coordinate. TripTrail puts the itinerary, bookings and group chat in one place.

2. Target users

College students and young professionals (18–30) planning short group trips, mainly to hill stations and beaches in Kerala, Tamil Nadu and Karnataka.

3. Must-have features for v1.0

Trip planner with day-by-day itinerary. Search for destinations, stays and activities. Booking with online payment (Razorpay: cards and UPI) or pay at pickup. Real-time group chat per trip. Push reminders the day before each booking.

4. Out of scope for v1.0

Offline maps, flight booking, splitting costs between group members (planned for v1.1), and a web version.

5. Success metrics

1,000 completed bookings in the first 30 days after launch. Day-7 retention above 25%. Crash-free sessions above 99.5%. Average app store rating of 4.3 or higher.

6. Non-functional requirements

Search must return results in under 800 ms at the 95th percentile. All payment data is handled by Razorpay; TripTrail never stores card numbers. User location is only collected while a trip is active, and this must be stated in the privacy policy and the Play Store data safety form.

7. Risks

Payment gateway approval delays (Razorpay KYC). App Store review rejections, usually because of a missing privacy policy link. Google Maps API costs growing faster than bookings.
